

VOICE MENU SYSTEM

ABSTRACT OF THE DISCLOSURE

A voice menu system is disclosed. The present invention generally allows for updateable audio menus. Although a device might have some pre-packaged menu components, other menu components can be received from a server. Each menu component, regardless of whether it is original or received from the server, has an associated voiced name. When a user highlights a menu choice, the voiced name can be played. The user then has the option of selecting the menu choice or scrolling to a new menu choice. In this way, a user could navigate the menu without having to actually see a visual display of the menu, which may be especially useful for users unable to see the visual display or users with visual disabilities.
